

1 ABSTRACT

2 In an embodiment, a method of secure information
3 distribution between nodes, includes: performing a
4 handshake process with an adjacent node to determine
5 membership in a secure group; and distributing secure
6 information to the adjacent node, if the adjacent node is a
7 member of the secure group. In another embodiment, an
8 apparatus for secure information distribution between
9 nodes, includes: a node configured to performing a
10 handshake process with an adjacent node to determine
11 membership in a secure group, and distribute secure
12 information to the adjacent node, if the adjacent node is a
13 member of the secure group.
